Abstract

Aphids (Hemiptera: Aphididae) are small soft bodied plant lice, their number rapidly rise above economic threshold level in suitable climatic condition due to parthenogenetic development. They have great agricultural importance due to polyphagism, polymorphism, parthenogenetic viviparity and remarkable ability to transmit various pathogenic viruses. They damage the crops directly by sucking the nutrients that cause devitalisation of plants. Many coccinellids are predators and major biological control agents of hemipteran pests such as aphids, mealy bugs, scale insects, white flies, as well as thrips and mites and other soft bodied insects. Due to predaceous nature, seasonal synchrony with their specific preys, high foraging performance, immense predation potential and high reproductive efficacy, they possess the potential to be effectively employed in Integrated Pest Management. Globally, more than 6000 ladybird beetle species are known to us, out of which, 261 predaceous species belonging to 57 genera reported from India. In biological control programme, several coccinellids predators are reported as effective bioagent against aphids viz., *Aphidecta obliterate* on *Adelges piceae*, *Cheilomenes lunata* on *Aphis craccivora*, *Coccinella sexmaculata* on *Aphis aurantii* and *Myzus persicae*, *Coccinella transversalis* on *Aphis aurantii* and *Myzus persicae*, *Coccinella undecimpunctata* on several aphids. In India, 13 species of coccinellids viz., *Coccinella krikkeni* Iablokoff-Khnzorian, *Coccinella lama* Kapur, *Coccinella luteopicta* (Mulsant), *Coccinella magnopunctata* Rybakow, *Coccinella marussii* Kapur, *Coccinella nigrovittata* Kapur, *Coccinella repanda* Thunberg, *Coccinella saucerottei* Mulsant, *Coccinella septempunctata* Linnaeus, *Coccinella transversalis* Fabricius, *Coccinella transversoguttata* Faldermann, *Coccinella undecimpunctata* Linnaeus and *Coccinella undecimpunctata aegyptiaca* Reiche are reported. Among these, *C. septempunctata* and *C. transversalis* are very common and widely distributed in India.

INTRODUCTION

Aphids (Hemiptera: Aphididae) are small, soft bodied plant lice and their number rapidly rise above economic threshold level in suitable climatic condition due to parthenogenetic development. They have great agricultural importance due to polyphagism, polymorphism, parthenogenetic viviparity and remarkable ability to transmits various pathogenic viruses^{45,53}. Aphids attack all parts of the plant such as stem, leaves, inflorescence and even roots. They damage the crops directly by sucking the nutrients that cause devitalisation of plants. Hence, the management of aphids is essential to control the population. Integrated Pest Management (IPM) is an ecosystem-based strategy that focuses on long-term prevention of pests or their damage through a combination of techniques such as biological control, habitat manipulation, modification of cultural practices, and use of resistant varieties. Pest control methods are applied in a manner that minimizes risks to human health, beneficial and nontarget organisms and the environment. There are several predators are used to insect-pests management as biological control agents.

Many coccinellids are predators and major biological control agents of several hemipteran pests (aphids, mealy bugs, scale insects, white flies etc.) because they possess high foraging performance, predatory efficiency and high reproductive potential. Hence these insects constitute important natural predatory or enemy complex of many agricultural and horticultural crop pests. Globally, more than 6000 ladybird beetle species are known, out of which, 261 predaceous species belonging to 57 genera are reported from India¹⁰⁷. In contrast, 36 true aphidophagous coccinellids with 16 incidental or doubtful species and 13 unidentified species of predaceous coccinellids have earlier been reported from India³. In biological control programme, several coccinellid predators are reported as effective bioagent against aphids viz., *Aphidecta oblitterata* on *Adelges piceae*, *Cheilomenes lunata* on *Aphis craccivora*, *Cheilomenes sexmaculata* on *Aphis aurantii* and *Myzus persicae*, *Coccinella transversalis* on *Aphis aurantii* and *Myzus persicae*, *Coccinella undecimpunctata* on several aphids¹⁰⁸.

13 species of coccinellids viz., *Coccinella krikkeni* Iablokoff-Khnzorian, *Coccinella lama* Kapur, *Coccinella luteopicta* (Mulsant), *Coccinella magnopunctata* Rybakow, *Coccinella marussii* Kapur, *Coccinella nigrovittata* Kapur, *Coccinella repanda* Thunberg, *Coccinella saucerottei* Mulsant, *Coccinella septempunctata* Linnaeus, *Coccinella transversalis* Fabricius, *Coccinella transversoguttata* Faldermann, *Coccinella undecimpunctata* Linnaeus and *Coccinella undecimpunctata aegyptiaca* Reiche are reported from India. Among these, *C. septempunctata* and *C. transversalis* are very common and widely distributed in India.

1. *Coccinella septempunctata* Linnaeus

(*Coccinella septempunctata* divaricata Oliver)

Distribution: It is one of the most common and widely distributed in several states in India., Agartala³, Andra pradesh²⁷, Assam^{35,36,133,156} Bihar^{6,7,114}, Goa⁷², Haryana¹⁵¹, Himachal Pradesh^{37,84,85,87,141}, Jharkhand³⁰, Karnataka^{15,65,66}, Kashmir^{16,17,76,77,96}, Meghalaya^{8,49}, Mezoram^{147,148}, Manipur and Nagaland^{97,136,138}, Mysore¹²², Odisha^{95,110} Tamil Nadu^{123,129}, Tripura⁹⁰, Uttar Pradesh^{24,28,46,55,98,106}, Uttarakhand^{20,51,63,117,140,159}, West Bengal^{38,48,57,89,118,128,130,134}.

Morphological Characters: Beetle is oval in shape and polymorphic in forms. Body convex and densely punctate. The black head bears a pair of black eyes and a pair of brown antennae (11 segmented). The reddish and yellowish incolour elytra bear seven small spots, three on each elytron and one situated on median apical margin. Pronotum black and twice broad as long. Scutellum black or brownish-black and mostly equilateral.

Host aphids and plant: Earlier, it has been reported on 91 species of aphids in India (Table-1). However, in agricultural fields of Uttar Pradesh it was found abundantly on the *Aphis craccivora*, *Aphis gossypii*, *Aphis nerii*, *Rhopalosiphum maidis* and *Myzus persicae*.

2. *Coccinella transversalis* Fabricious

(*Coccinella repanda* Thunberg; *C. repanda transversalis* Thunberg)

Distribution: *Coccinella transversalis* is a very common and widely distributed in India. The ladybeetle is uniformly distributed throughout the country., Agartala², Andamans⁷¹, Andra Pradesh⁶², Assam^{19,22,33,131,133,156}, Bihar^{6,7,114}, Chhattisgarh^{78,82,83}, Goa⁷², Gujarat^{113,143}, Himachal Pradesh^{84,85,86}, Jharkhand⁴⁷, Kashmir⁹², Karnataka^{29,65,66,93,122}, Maharashtra⁶⁸, Manipur^{32,39,40,41,97,145,152}, Mezoram^{147,148}, Nainital⁶⁴, Nagaland^{137,138}, Tamil Nadu^{123,129}, Telangana¹²⁶, Tripura⁹⁰, Uttarakhand^{94,117}, Uttar Pradesh^{46,55,99,100,102,103,104,106,107}, West Bengal^{55,57,89,119,130,134}.

Morphological Characters: Body is slightly elongated; oval, convex, dark blackish brown head bears a pair of blackish eyes and brownish antennae. Pronotum with orange spots on antero-lateral side; dull orange elytra, three transverse and zig-zag black marking on each reddish color elytron. There is a longitudinal black broad band along the inner junction of elytra.

Host aphids and plants: It was reported to feed on more than 35 species of aphids in India (Table- 1). Its high degree of predation was reported on *A. craccivora*, *A. gossypii*, *S. miscanthi* and *M. persicae*. Thus, an account of its wide spectrum occurrence and wide spectrum of prey with huge predation potential, it may be regarded as most potent biocontrol agent of aphid pests of our crops. Both the adults and grubs are potent predators of aphids.

3. *Coccinella undecimpunctata* Linnaeus

(*Coccinella 4-punctata menestriesi* Mulsant)

Distribution: Distributed in palaearctic region and India¹²⁰. In India, it is distributed only three states viz., Agartala³, Kashmir^{13,14,16,17,18}, Uttar Pradesh²⁸. The ladybeetle was introduced to North America from India³.

Morphological Characters: Body moderately convex and elongate a pronotum is black except antero-lateral margin and corners white to creamy yellow. Elytra red with whitish patches on either side of scutellum. One common scutellar spot and five black spots on each elytron.

Host aphid and plant: The predator was reported to feed on 14 aphid species. The most common aphids were *A. gossypii*, *L. erysimi*, *S. graminis* and *S. miscanthi* (Table- 1).

159. Yadav, S.K. & Patel, S. (2015). Insect-pest complex on *Pisum sativum* L. and their natural enemies at Pantnagar. *Journal of Plant Development Sciences*, 7(11): 839-841.

Dr. Md. Equbal Ahmad is Professor, Dept. of Zoology, Tilka Manjhi Bhagalpur University. He has completed his M.Sc. and M.Phil. from A.M.U. Aligarh and did his Ph.D. from DDU, Gorakhpur University. He has more than 30 years of research experience in the field of Toxicology, Bio-ecology and Biosystematics of aphids, their parasitoids and predators. He has received young scientist award by AZRA, Cuttack. He has also completed a major research project of DST. He is a member of editorial Board of several journals. He has published more than 50 research articles in National and International Journals.

Dipti Nawal has completed her M.Sc. degree in Zoology (Entomology) from Tilka Manjhi Bhagalpur University. She is pursuing Ph.D. on the influence of host plants on predatory potential of coccinellid predatory. She has three publications in UGC care listed journal.

Megha Kumari has completed her M.Sc. degree in Zoology (Entomology) from Tilka Manjhi Bhagalpur University. She is pursuing Ph.D. on the study of life table statistics of *Micraspis discolor*.

Kimmi Kumari has completed her M.Sc. degree in Zoology (Entomology) from Tilka Manjhi Bhagalpur University. She has qualified Joint CSIR-UGC NET (LS) June 2020 in Life Sciences. She has submitted her Ph.D. thesis on predatory potential of syrphid predator. She has three publications in UGC care listed journal.
